

Rapid evidence checks are based on a simplified review method and may not be entirely exhaustive, but aim to provide a balanced assessment of what is already known about a specific problem or issue. This brief has not been peer-reviewed and should not be a substitute for individual clinical judgement, nor is it an endorsed position of NSW Health.

Workforce reconfiguration

Evidence check questions

1. What is the evidence regarding temporary workforce reconfigurations such as splitting of teams and establishing social distancing protocols within teams to minimise staff exposure to COVID-19?
2. What is the evidence regarding temporary workforce reconfigurations to maintain or increase workforce surge capacity during the COVID-19 pandemic?

In brief

- Workforce reconfigurations during the COVID-19 pandemic such as splitting teams, creating smaller 'sub teams' and establishing social distancing protocols within teams have been described for a range of specialties including general surgery, oncology, radiology, cardiology, emergency departments and dialysis units. Workforce reconfiguration during periods of heightened COVID-19 prevalence is associated with reduced infection rates in the healthcare workforce.
- A wide range of institutional or departmental workforce reconfiguration strategies are described in the peer-reviewed literature (Table 1). Many of these strategies were developed and adopted rapidly during COVID-19 surge periods.
- The most commonly used workforce reconfiguration strategies included redeploying specialty staff or research-only clinical staff into COVID-19-specific or critical care workforce, both internally within hospitals and externally; and redistributing excess workforce from non-critical areas or areas with reduced work demand to critical areas or areas in need.. There are no studies to evaluate the impact of staff working outside their normal scope of practice.
- In Australia, a Critical Care Pandemic Staffing Working Party made 60 recommendations to inform multidisciplinary workforce capacity expansion planning in critical care.¹ They range from service-level recommendations for maintaining the critical care workforce, expanding the critical care workforce, rostering and allocation, nursing-specific recommendations for staffing the ICU, workforce support, environmental management, models of care and de-escalation.¹
- The World Health Organization recommends that generalist health workers, workers from other health settings, and recent medical graduates be redeployed to settings facing skills shortages.²

Limitations

Evidence is based on single case experiences.

Background

Healthcare workers are at heightened risk of COVID-19 infection. One way to minimise infection among staff is through workforce reconfigurations to limit exposure.

Methods (Appendix 1)

PubMed and Google searches were run on 1 September and 6 September 2021.
